

The 15SW3A is a high-power 15-inch subwoofer, designed for use in car audio applications. It is specifically designed to reproduce the range of 38 to 150 Hz in a small vented box enclosure

The 15SW3A is capable of handling up to 1100 watts RMS (AES or 2200 watts continuous program power).

A bumped and undercut T-yoke assures a minimum of magnetic rectification (off-centering) and a compatible maximum displacement (Xlim). The extended pole ensure a correct magnetic flux distribution and improve the thermal dissipation. The magnet circuit was optimized by finite element software. Special attention was given to the driver's behavior under mechanical overload conditions, meaning that all but the most severe abuse will be tolerated - without failure.

The 15SW3A employ a 4" (100mm) diameter 4-layer aluminum round wire voice-coil. This is wound on a fiberglass-composite former, twice the thickness of typical formers, to drive the moving assembly with great rigidity.

The pressed-long-fiber-coated pulp cone has the necessary mass and stiffness to withstand the tremendous accelerating forces required, and is precisely centered by two counter-balancing, distortion canceling, polyester-cotton-fiber spiders.

A reinforced aluminum frame is highly effective in withstanding mechanical shocks and vibration. It also acts as a heat-sink for the motor, without removing energy from the loudspeakers intended magnetic gap. The aluminum frame includes six vents that allow air exchange between the spider and the top-plate. This helps to reduce top-plate temperature, in turn cooling the voice-coil. The magnetic-circuit also employs a multi-cooling system (patent pending) consisting of a large diameter center hole, surrounded by six smaller holes that forces cool air across the voice-coil. These features insure an extremely efficient heat transfer from voice-coil to surroundings, resulting in very high thermal power handling.

**SPECIFICATIONS**

|  |             |         |
|--|-------------|---------|
| Nominal diameter                                 | 380 (15)    | mm (in) |
| Nominal impedance                                | 4           | Ω       |
| Minimum impedance @ 88.6 Hz                      | 3.63        | Ω       |
| <b>Power handling</b>                            |             |         |
| Musical program <sup>1</sup>                     | 2200        | W       |
| AES <sup>2</sup>                                 | 1100        | W       |
| Sensitivity (2.0V@1m) averaged from 50 to 150 Hz | 92          | dB SPL  |
| Power compression @ 0 dB (nom. power)            | 2.0         | dB      |
| Power compression @ -3 dB (nom. power)/2         | 1.3         | dB      |
| Power compression @ -10 dB (nom. power)/10       | 0.9         | dB      |
| Frequency response @ -10 dB                      | 38 to 1,500 | Hz      |

<sup>1</sup> Power handling specifications refer to normal speech and/or music program material, reproduced by an amplifier producing no more than 5% distortion. Power is calculated as true RMS voltage squared divided by the nominal impedance of the loudspeaker.

<sup>2</sup> AES Standard (60 - 600 Hz).

**THIELE-SMALL PARAMETERS**

|   |                 |                                    |
|---|-----------------|------------------------------------|

Minimum clearance between the back of the magnetic assembly and the enclosure wall . . . . . 75 (3) mm (in)

Dimensions in mm.

**RESPONSE CURVES (0° AND 45°) IN A TEST ENCLOSURE IN ANECHOIC CHAMBER, 1 W / 1m**

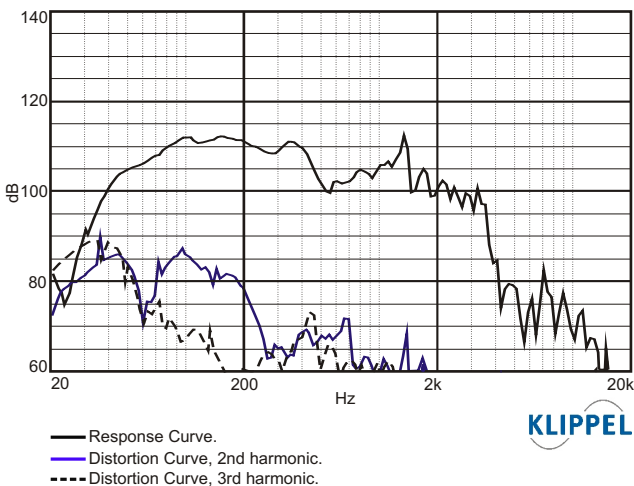

Response curves measured in anechoic chamber with the subwoofer installed in a test enclosure, 1 W / 1 m.

**IMPEDANCE AND PHASE CURVES, MEASURED IN FREE-AIR**

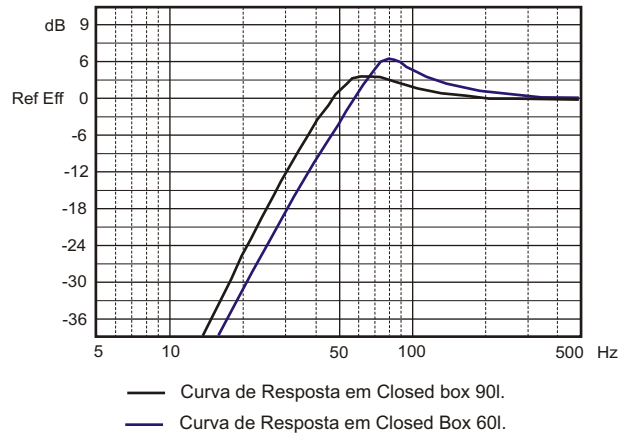

**HARMONIC DISTORTION CURVES MEASURED AT 10% AES INPUT POWER IN A TEST ENCLOSURE INSIDE AN ANECHOIC CHAMBER, 1 m**

**TEST ENCLOSURE**

100-liter volume with 3 ducts ø 6" by 7.87" length.

**SOFTWARE SIMULATED FREQUENCY RESPONSE CURVE**

**SUGGESTED ENCLOSURES**

| TYPE   | CLOSED BOX               |                          | VENTED BOX |                     |
|--------|--------------------------|--------------------------|------------|---------------------|
|        | Internal Volume (Liters) | Internal Volume (Liters) | Vent (s)   |                     |
|        |                          |                          | Qty        | Diam. x Length (cm) |
| 15SW3A | XX                       | 90<br>60                 | 3<br>3     | 10 x 06<br>10 x 05  |

**ENCLOSURE INTERNAL VOLUME CALCULATION INSTRUCTIONS**

**TRAPEZOID RECTANGULAR**

$$\text{Internal Volume} = \frac{A \times B \times \left(\frac{C+D}{2}\right)}{1000}$$

**RECTANGULAR**

$$\text{Internal Volume} = \frac{A \times B \times C}{1000}$$

A, B C and D are internal dimension (in cm). The internal volume result is given in liters.

The suggested enclosure volumes are related to only one speaker, including woofer and duct(s) displaced volume.

For enclosure with more than one speaker, it is necessary to multiply the suggested volume and duct(s) by the quantity of speakers and build them with separated chambers (internal division).

Box volumes considering the bass lift inside the car with closed apertures.

**HOW TO CHOOSE THE RIGHT AMPLIFIER**

The power amplifier must be able to supply twice the RMS driver power. This 3 dB headroom is necessary to handle the peaks that are common to musical programs. When the amplifier clips those peaks, high distortion arises and this may damage the transducer due to excessive heat. The use of compressors is a good practice to reduce music dynamics to safe levels.

**FINDING VOICE COIL TEMPERATURE**

It is very important to avoid maximum voice coil temperature. Since moving coil resistance ( $R_z$ ) varies with temperature according to a well known law, we can calculate the temperature inside the voice coil by measuring the voice coil resistance:

$$T_B = T_A + \left(\frac{R_B}{R_A} - 1\right) \left(T_A - 25 + \frac{1}{\alpha_{25}}\right)$$

$T_A, T_B$  = voice coil temperatures in °C.

$R_A, R_B$  = voice coil resistances at temperatures  $T_A$  and  $T_B$ , respectively.

$\alpha_{25}$  = voice coil wire temperature coefficient at 25 °C.

**POWER COMPRESSION**

Voice coil resistance rises with temperature, which leads to efficiency reduction. Therefore, if after doubling the applied electric power to the driver we get a 2 dB rise in SPL instead of the expected 3 dB, we can say that power compression equals 1 dB. An efficient cooling system to dissipate voice coil heat is very important to reduce power compression.

**NON-LINEAR VOICE COIL PARAMETERS**

Due to its close coupling with the magnetic assembly, the voice coil in electrodynamic loudspeakers is a very non-linear circuit. Using the non-linear modeling parameters  $K_{rm}$ ,  $K_{xm}$ ,  $E_{rm}$  and  $E_{xm}$  from an empirical model, we can calculate voice coil impedance with good accuracy.
